The present invention relates to an improvement in an apparatus and method for magnetic resonance imaging (MRI) which generates a tomographic image of an object which is arranged in a strong magnetic field, and in particular, relates to an improvement in an imaging field setting method in which a portion of an image obtained by the MRI apparatus is corrected by observation of a field map data. In a conventional magnetic resonance imaging apparatus, the position of a magnet pole for applying a strong magnetic field, i.e., a main magnetic pole, is adjusted by measuring the position of the magnet pole based on the magnetic resonance signals from the object. This adjusting operation is performed manually by entering data of the position of the main magnetic pole measured as the target values to an analog output control unit of a main magnetic pole position controller. In this case, the data input to the main magnetic pole position controller is generally obtained by using a manually f678ea9f9e
